

Dry brushing your body (towards your heart) is also helpful in supporting your lymphatic system. Carve out time during the day to exercise for at least 30 minutes. You can do any form of light to moderate exercises, walking included. Walking for 10–15 minutes after each meal does wonders for your digestion. Please refrain from intense exercises.

Your last meal or snack should be no later than 8pm. Ideally earlier if possible. Have something that is rich in magnesium to help you wind down and rest well. You may opt for a high quality magnesium glycinate supplement. Pumpkin seeds are also very high in magnesium, but you need to complement them with a food that contains glycine, such as bone broth. The reason why you don't want to eat beyond 8pm is because you can interfere with your liver's circadian rhythm and increase fat build-up. This allows your liver to finish processing your last meal. This is also important so you can allow your liver to process toxins. If you must eat something, then opt for fruit or tea.

Aim to be in bed by 10pm latest to get 8 hours of sleep. You want to start winding down a couple hours before bed. Screen time needs to be suspended at least one hour before bedtime. Here's why this is important: the liver functions on a 24-hour biological clock, set by light exposure. This is your natural circadian rhythm. Going to bed by 10pm allows the liver to harmonize with its natural rhythm, allowing detoxification and repair to peak between 11pm and 3am. During this time, deep sleep allows the liver to process toxins, balance blood sugar, reduce fat buildup, and avoid fatty liver disease. If you need help winding down, guided meditations are very helpful.

Overall, focus on consistent meal times and avoid eating after 8pm as much as possible. Remember, this isn't meant to be rigid. Just do your best to ensure that you're having nutrient-dense meals each day.
