

Phase Two

Welcome to Phase Two! Pay close attention because this phase will be happening sequentially with Phase One and concurrently with Phase Three. Remember, it's all like a tandem system.

Phase Two is the conjugation phase. This is where those smaller, highly reactive intermediate substances are neutralized by attaching glutathione or amino acid molecules to make them water-soluble for easy excretion. This is also where you'll need support from sulphur-rich foods like raw garlic, onions, and continuing with cruciferous vegetables. You will need to be continuing with amino-acid foods and also glutathione-producing foods. Continue to drink lots of water as you'll need the support for Phase Three as toxins begin to exit.

Phase Three

You've made it to the final phase. Phase Three is the elimination or excretion phase. Diet is focused on fiber, ferments, and hydration. Here, you'll continue with bitter leafy greens and healthy fats for bile flow and digestion but you'll also be focusing on fiber-rich foods and hydration. Think apples, oats, flaxseeds, chia seeds, beans, lentils, and herbal teas like peppermint and ginger. At this stage, toxins are exiting your body. This is the reason why the Preparation Phase was especially important so that you can make way for the viral load to leave.
