

The Hiding Place

Unveiling where the herpes virus hides

HSV 1 and HSV 2 both hide in your peripheral nervous system, but in different areas. HSV 1, which is responsible for cold sore breakouts on your face, hides in your trigeminal ganglia. This is the temple area between your eyes and ears.

As illustrated below, the **yellow** in the image is your trigeminal ganglion. This is where HSV 1 hides. Each nerve is a pathway for viral outbreaks. This explains why people experience sores around their eyes, nose, mouth, and chin.

HSV 2, which is responsible for genital outbreaks, hides in the sacral dorsal root ganglia near your lower back and pelvic area and can spread out to the peripheral autonomic nerve ganglia. See the image below for a clearer visual understanding.
