How do I know when I'm at each phase?

The first sign that you are ready to move on from the Preparation Phase is that you are drinking enough water daily and you have cut out alcohol, caffeine, processed sugars, processed foods and other unhealthy habits like smoking. You will also know that you are ready for Phase One when you begin to have at least one healthy bowel movement daily. Now, for the remaining phases, there won't necessarily be obvious signs to inform you what's going on in your body; however, there may be some subtle warnings that'll guide you.

In Phase One (and possibly the Preparation Phase), you may notice some mild temporary headaches, fatigue, or irritability as toxins get released into circulation. This is known as the Herxheimer reaction. In Phase Two, you may notice that the effects in Phase One are steady and not necessarily intensifying. It's almost like a continuation of the mild symptoms you may feel in Phase One. Good signs are that your mood is stable, you have normal energy levels, and you're not experiencing major skin breakouts. However, if you do notice that these symptoms are getting more intense, it means that Phase One is running a little fast, causing oxidative stress, and Phase Two is having a hard time keeping up. If Phase One is too fast, you may experience jitters and nausea and more intense headaches or breakouts. In Phase Three, positive signs are healthy bowel movements, frequent clear urination, and light sweating. You may also notice an increase in energy, clearer focus, and relief from fatigue and sluggishness. That's a sign of successful toxin exit!

If you are noticing more intense Herxheimer reaction symptoms, then it's advisable to increase the antioxidants like berries, citrus, and hydration. It's also common for outbreaks to worsen or appear in unusual areas as the virus fights back. Don't panic. Stay the course. Continue eating well to encourage your amino acid, sulphur, cruciferous, and glutathione foods to lock on to the toxins that are causing a negative reaction. Don't be alarmed. Given the nature of this detoxification, it's expected that the viral toxins will fight back as they are being pushed out. Know that your body is doing what it's meant to do. Your aim is to neutralize the toxins as quickly as possible. And, continue to keep your pathways open with fiber-rich foods and hydration. Keep up with light to moderate daily movement to get your body sweating. Alternatively (or additionally), take warm baths with Epsom salts to aid in pulling toxins out through the skin. Avoid saunas and they can be a little too intense. Be gentle with your body. Give yourself grace and be patient. Trust your body.
