

How long should I do the protocol?

You should keep going for as long as it takes. While there is not an exact timeline, it all depends on each individual, lifestyle, igG test numbers, and how well the plan is adhered to. Some may have more severe symptoms with higher igG scores than others so the amount of time may differ from person to person. Remember that this is not a get fixed quick plan. Keep pushing until you get your true negative result. You've got this! After all you're trying to eradicate something that has been hiding in you for a very long time. Be patient with the process and give yourself grace and time to heal. The sacrifice will be worth it in the end. Results may vary.

Can the virus come back if I stop eating healthy?

People often wonder if the virus will return if you adapt an unhealthy eating habit again. And the answer is no. However, if you do get exposed to someone who is carrying the virus, it is possible that you can contract it again just as you did before. You don't contract it just because you had it before. You contract it based on exposure. What you need to understand is that bad diet didn't cause the virus, but bad diet can make it easy to stay and hide. When your body's defense (the immune system) is clogged up, pathogens sneak through much more easily and they stay and wreak havoc. But once you successfully eradicate it, you'll want to start thinking thrice about who you exchange your next make out session or one night stand with.

How should I prepare my meals?

For best results, it's recommended to eat your fruits and vegetables fresh, raw and uncooked. You can also make raw juices and smoothies as well. However, if you really don't want to have your vegetables raw, then you can blanch them or steam them very lightly. You do not want to overcook them *unless* you are using particular produce that must be cooked thoroughly before consumption, such as beans, legumes, eggplants, mushrooms, etc. Do your due diligence to know how to prepare your meals. Frozen fruit may be used as well.

How will I know when the virus is gone?

It's advisable to take a HSV 1 and/or HSV 2 test to know your numbers before you begin the protocol and as you progress through your healing journey. Do this so that you can track your progress and know what your IgG scores are. Once your test comes back true negative then you'll know you're done!

How do I avoid a false negative test result?

False negatives likely happen within 3-4 months **of exposure**. Ask your doctor for a type-specific igG blood test that's specifically for HSV 1 or HSV 2. Let them know that you do not want a igM test as they are unreliable. You can even go a step further and request a **University of Washington Western Blot** test as it can distinguish between the two HSV types. See the chart below to understand your igG values as you track it.
